INTRODUCTION

The tables in this report show the basic vital statistics of New York State, New York City, and the rest of the State subdivided by counties and places over 10,000 population in each of the years 1930-1939, and in the two five-year periods 1930-1934 and 1935-1939.

The estimates of population are based on the federal censuses of 1930 and 1940. Any deviations between the rates for 1930-1935 given in this publication and in Resident Vital Statistics, New York State, 1930-1935, which was issued several years ago, are due to the revision of the population estimates for these years.

The statistics for areas in which state or federal institutions are located are exclusive of these institutions.

Allocation of Births, Deaths, and Cases of Reportable Diseases Recorded within the State

All births have been allocated according to the usual place of residence of the mother.

Cases and deaths from communicable diseases have been allocated to place of origin of disease.

Deaths from all other causes have been allocated to the usual place of residence, which for institutional deaths is considered the place of residence at the time of admission to the institution. Experience has made it advisable to make three exceptions to this rule:

Tuberculosis. Beginning with 1937, deaths from tuberculosis recorded in state or federal custodial institutions have been charged to the institution if the deceased had been an inmate of it more than five years and if the duration of the disease was either less than the length of stay in the institution or was unknown.

Accidents. Deaths from accidents have been allocated to the place of occurrence of the accident, except that for the years prior to 1938 such deaths in state and federal custodial institutions were allocated to place of residence of the victim rather than place of occurrence of the accident.

Infant Mortality. Prior to 1938, deaths of infants under one year were allocated to place of residence as stated on the death certificate. Since this was not always the place in which the mother resided at the time the child was born the infant mortality rates for certain communities were not entirely consistent. For this reason, beginning with 1938, infant deaths have been allocated to place of residence of the mother at the time the child was born, thus relating the deaths and the births to the same place of residence. The rates for the city of Lackawanna were particularly affected by the procedure formerly in use, therefore the 1930-1937 infant mortality figures relating to that city have been adjusted to make them comparable with those for 1938 and 1939.

Interstate Allocation of Births and Deaths

For the State as a whole and its two main subdivisions, the number of births to resident mothers and the number of deaths of residents recorded in other states generally balance the number of births and deaths of residents of other states recorded in this State. Therefore no correction has been made for this factor and the birth and death records of nonresidents of the State have been included in the totals for the entire State, New York City, and the rest of the State.

For smaller areas the nonresident records do not as a rule offset each other. Since information regarding the births and deaths of residents recorded in other states is usually received too late for inclusion in the annual reports of the Division of Vital Statistics, it has been impracticable to make a two-way current correction for this factor. Birth and death records of nonresidents of the State are excluded from the figures for counties, cities, and villages because the nonresident records are concentrated as a rule in communities whose hospital facilities attract out-of-state residents. This step, though clearly one-sided, introduces a smaller error than that which would result from the inclusion of nonresident data. An exception was made for Columbia, Dutchess, Putnam, and Tioga counties because a sizable proportion of births and infant deaths of their residents occur in adjacent states; for these counties the nonresident births and infant deaths were deducted and the births and infant deaths of residents recorded in other states added to the totals. The revision was made for the years 1931-1939, the necessary information not being available for 1930.

10-14-41-1500 (17-H2-149)

EXPLANATORY NOTES

The rates for 1930-1934 and 1935-1939 are based not on annual averages but on the combined population and the total number of births and deaths for each of the five-year periods.

The infant mortality rates for Lackawanna for 1930-1937 exclude those deaths in which Our Lady of Victory Infant Home was given as the residence. For 1938 and 1939 the deaths in Our Lady of Victory Infant Home have been allocated to the place of residence of the mother at the time the child was born.

"Other cardiovascular-renal diseases" comprise cerebral hemorrhage, cerebral embolism, and thrombosis; diseases of the arteries; nephritis, acute, chronic, and unspecified.

A stillbirth is defined as a birth without any evidence of life. The words "any evidence of life" include action of heart, breathing, or movement of voluntary muscle. A certificate for a stillbirth must be filed only if the child has advanced to the fifth month of gestation.

The basis for the rates in this report are: births and deaths from all causes, per 1,000 population; infant mortality, per 1,000 live births; stillbirths, per 1,000 live and still births; deaths from puerperal causes, per 10,000 live and still births; deaths from other specified causes, per 100,000 population.

(See pages 136-138 for Charts)
